

Durability of digital printing on Front Panels

The manufacturer guarantees the durability of the certified materials on the basis of the DIN 30643 (Wiping and Abrasion resistance of Inscriptions on Signage). Furthermore the durability was tested using acetone, cold cleaning fluid, oil, fat and superheated steam.

UV tests with a determined durability of 5 to 8 years were accomplished for anodized aluminium. None of the materials presented any changes visible to the naked eye after testing. Measurable discolourations are particularly present with the colours black and blue.
